

Prometheus for Practioners

Migrating to Prometheus at Fastly

Monitorama EU 2018 | Marcus Barczak
@ickymettle

fastly[®]

1. Deploy Prometheus across our infrastructure
2. Add [duplicate] Prometheus instrumentation
3. Deploy Prometheus exporters
4. Curate *new* set of dashboards and alerts
5. Run in parallel, to build confidence
6. Decommission old systems

Observability: The Hard Parts

Prometheus for Practioners

~~Migrating to Prometheus at Fastly~~
Observability: The "Easy" Parts

Monitorama EU 2018 | Marcus Barczak
@ickymettle

How **were** we
monitoring Fastly?

Growing pains with Ganglia

- ⦿ Operational overhead.
- ⦿ Limited graphing functions.
- ⦿ No alerting support,
- ⦿ No real API for consuming metric data.

fastly

Growing pains doubled

- ⦿ Now supporting **two** systems.
- ⦿ Where do I put my metrics?
- ⦿ Still writing external plugins and agents.
- ⦿ Monitoring treated as a "post-release" phase.

Scaling our infrastructure
horizontally

Required scaling our monitoring
vertically

Third time lucky

Project goals

- ◎ Scale with our infrastructure growth,
- ◎ Be easy to deploy and operate.
- ◎ Engineer friendly instrumentation libraries.
- ◎ First class API support for data access.
- ◎ To reboot our monitoring culture.

Getting started

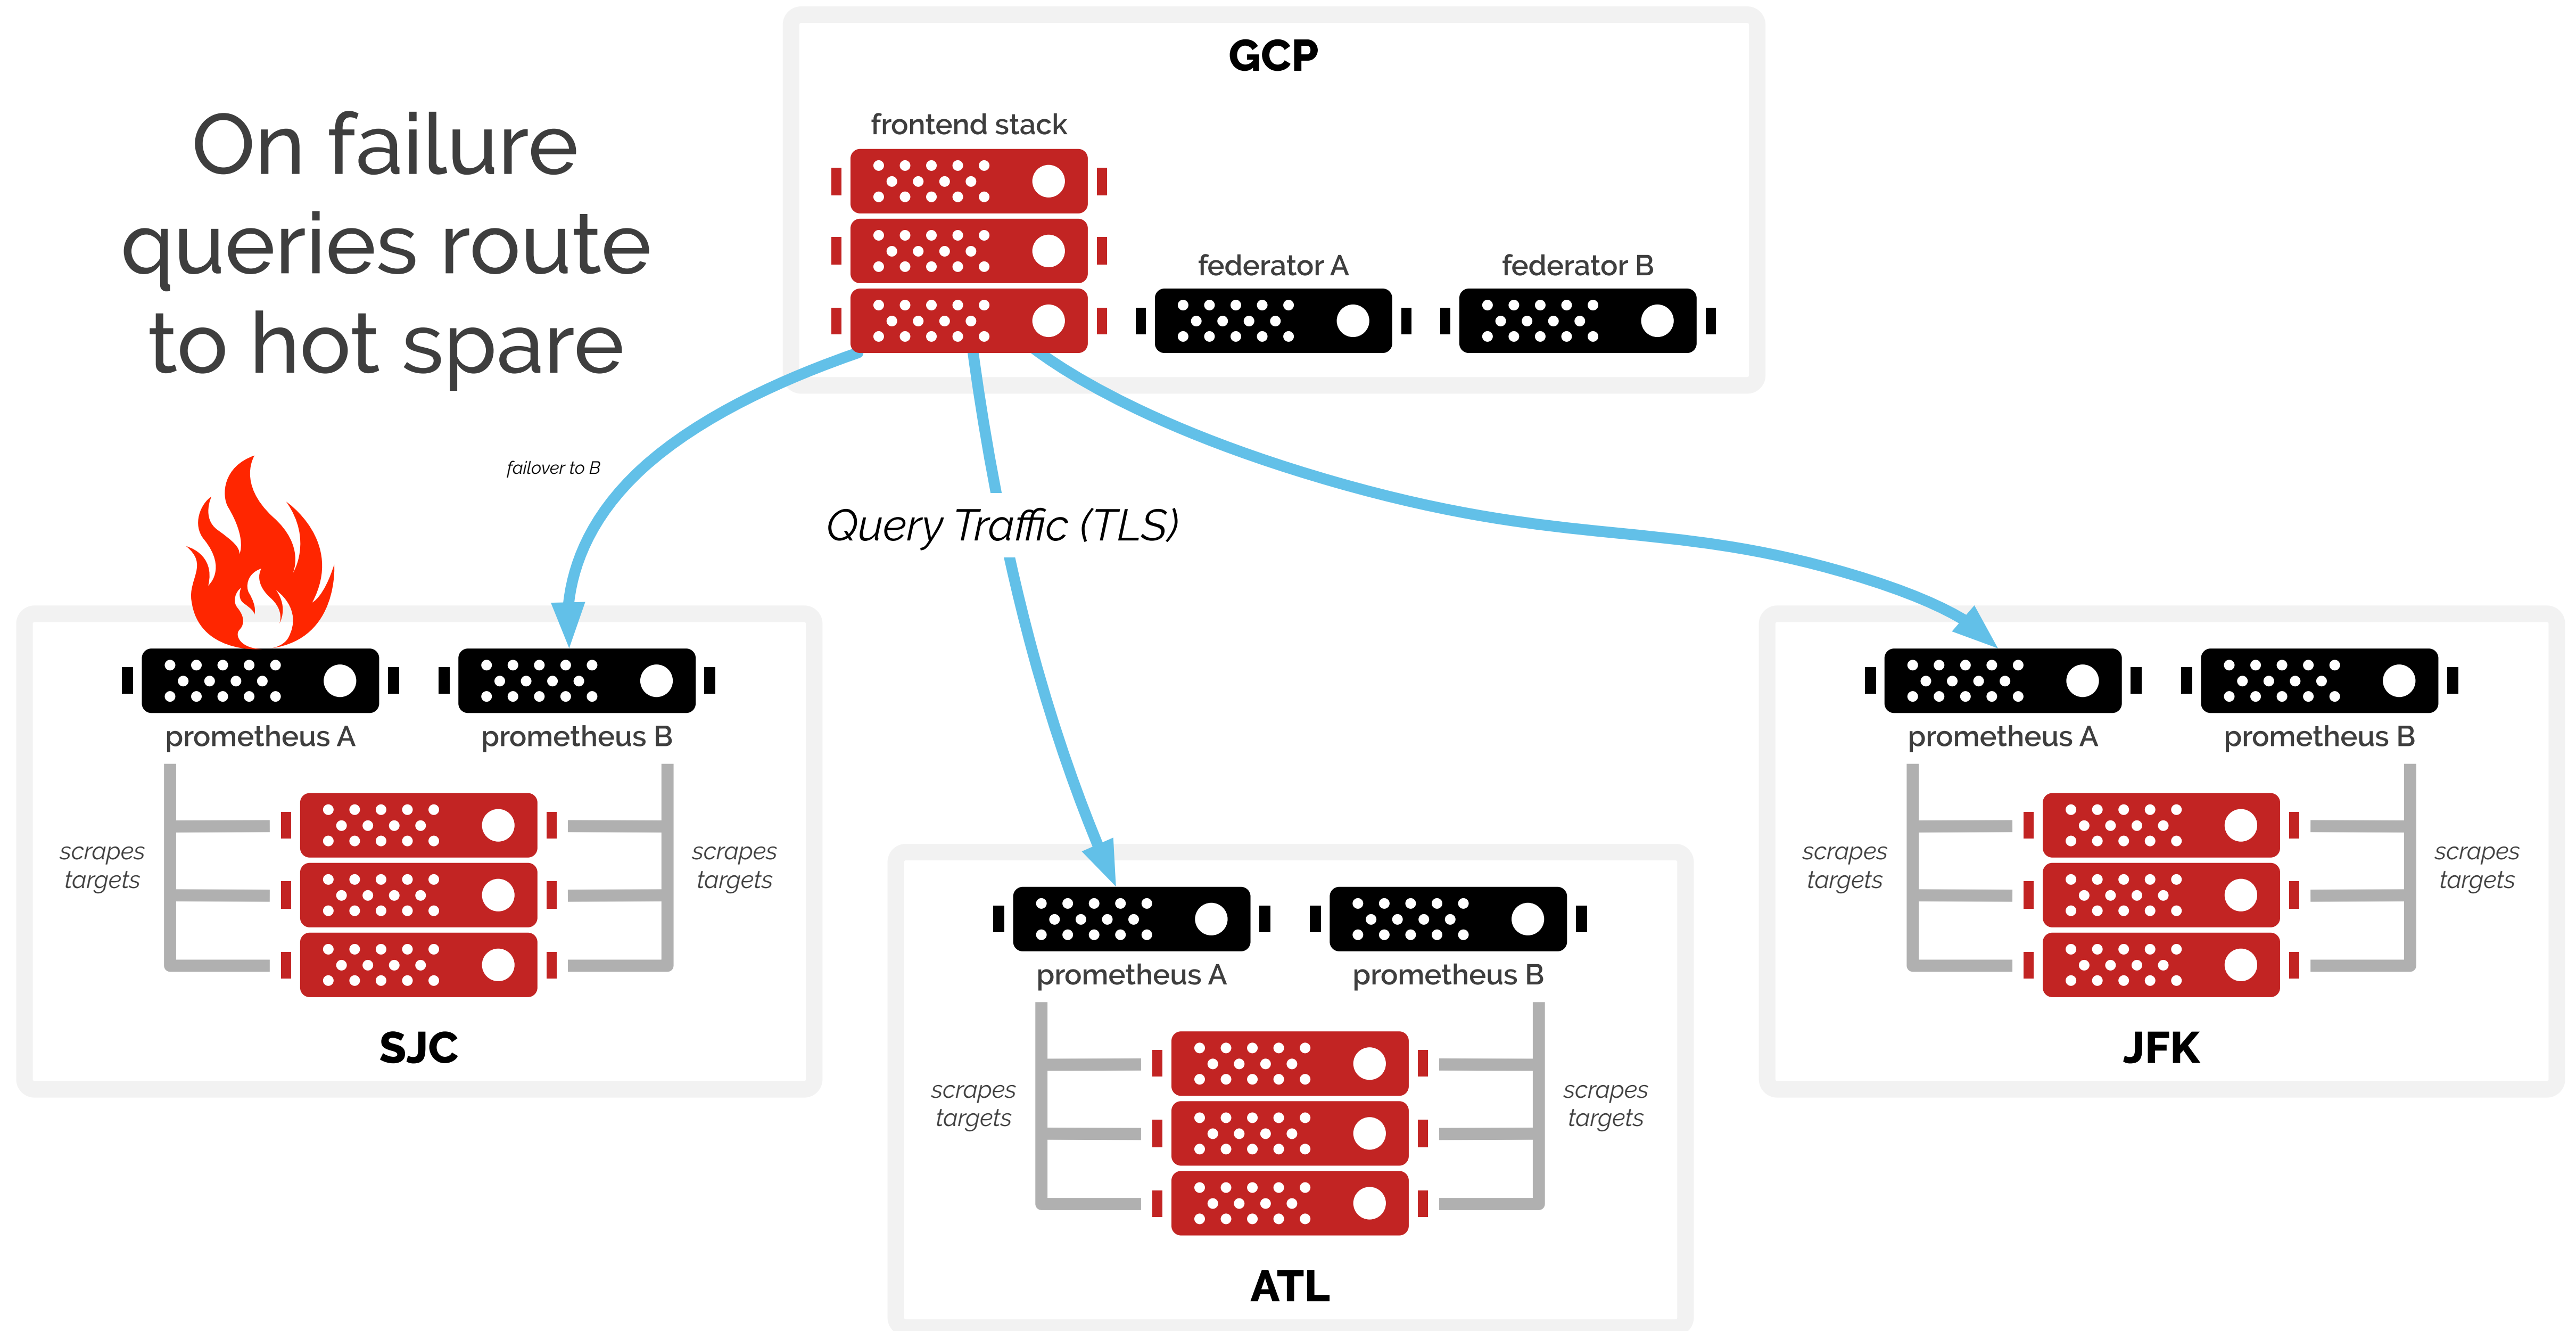

- ① Build a proof of concept.
- ① Pair with pilot team to instrument their services.
- ① Iterate through the rest.
- ① Run both systems in parallel.
- ① Decommission SaaS system and Ganglia.

Infrastructure build

On failure
queries route
to hot spare

Prometheus Server Software Stack

Ghost Tunnel

TLS termination and auth.

Service Discovery Sidecar

Target configuration

Rules Loader

Recording and Alert rules

Prometheus

Prometheus Server Software Stack

Ghost Tunnel

TLS termination and auth.

Service Discovery Sidecar

Target configuration

Rules Loader

Recording and Alert rules

Prometheus

Typical Server Software Stack

Exporters

Built into services or sidecar

Service Discovery Proxy

Service discovery and
TLS exporter proxy

**Build your own
service discovery?**

Fastly's infrastructure
is bare metal hardware
no cloud conveniences

Service discovery requirements

- ⦿ Automatic discovery of targets.
- ⦿ Self-service registration of exporter endpoints,
- ⦿ TLS encryption for all exporter traffic.
- ⦿ Minimal exposure of exporter TCP ports.

Prometheus Server Software Stack

Ghost Tunnel
TLS termination and auth.

Typical Server Software Stack

Exporters
Built into services or sidecar

PromSD Sidecar
Target configuration

generates config
for prometheus

Prometheus

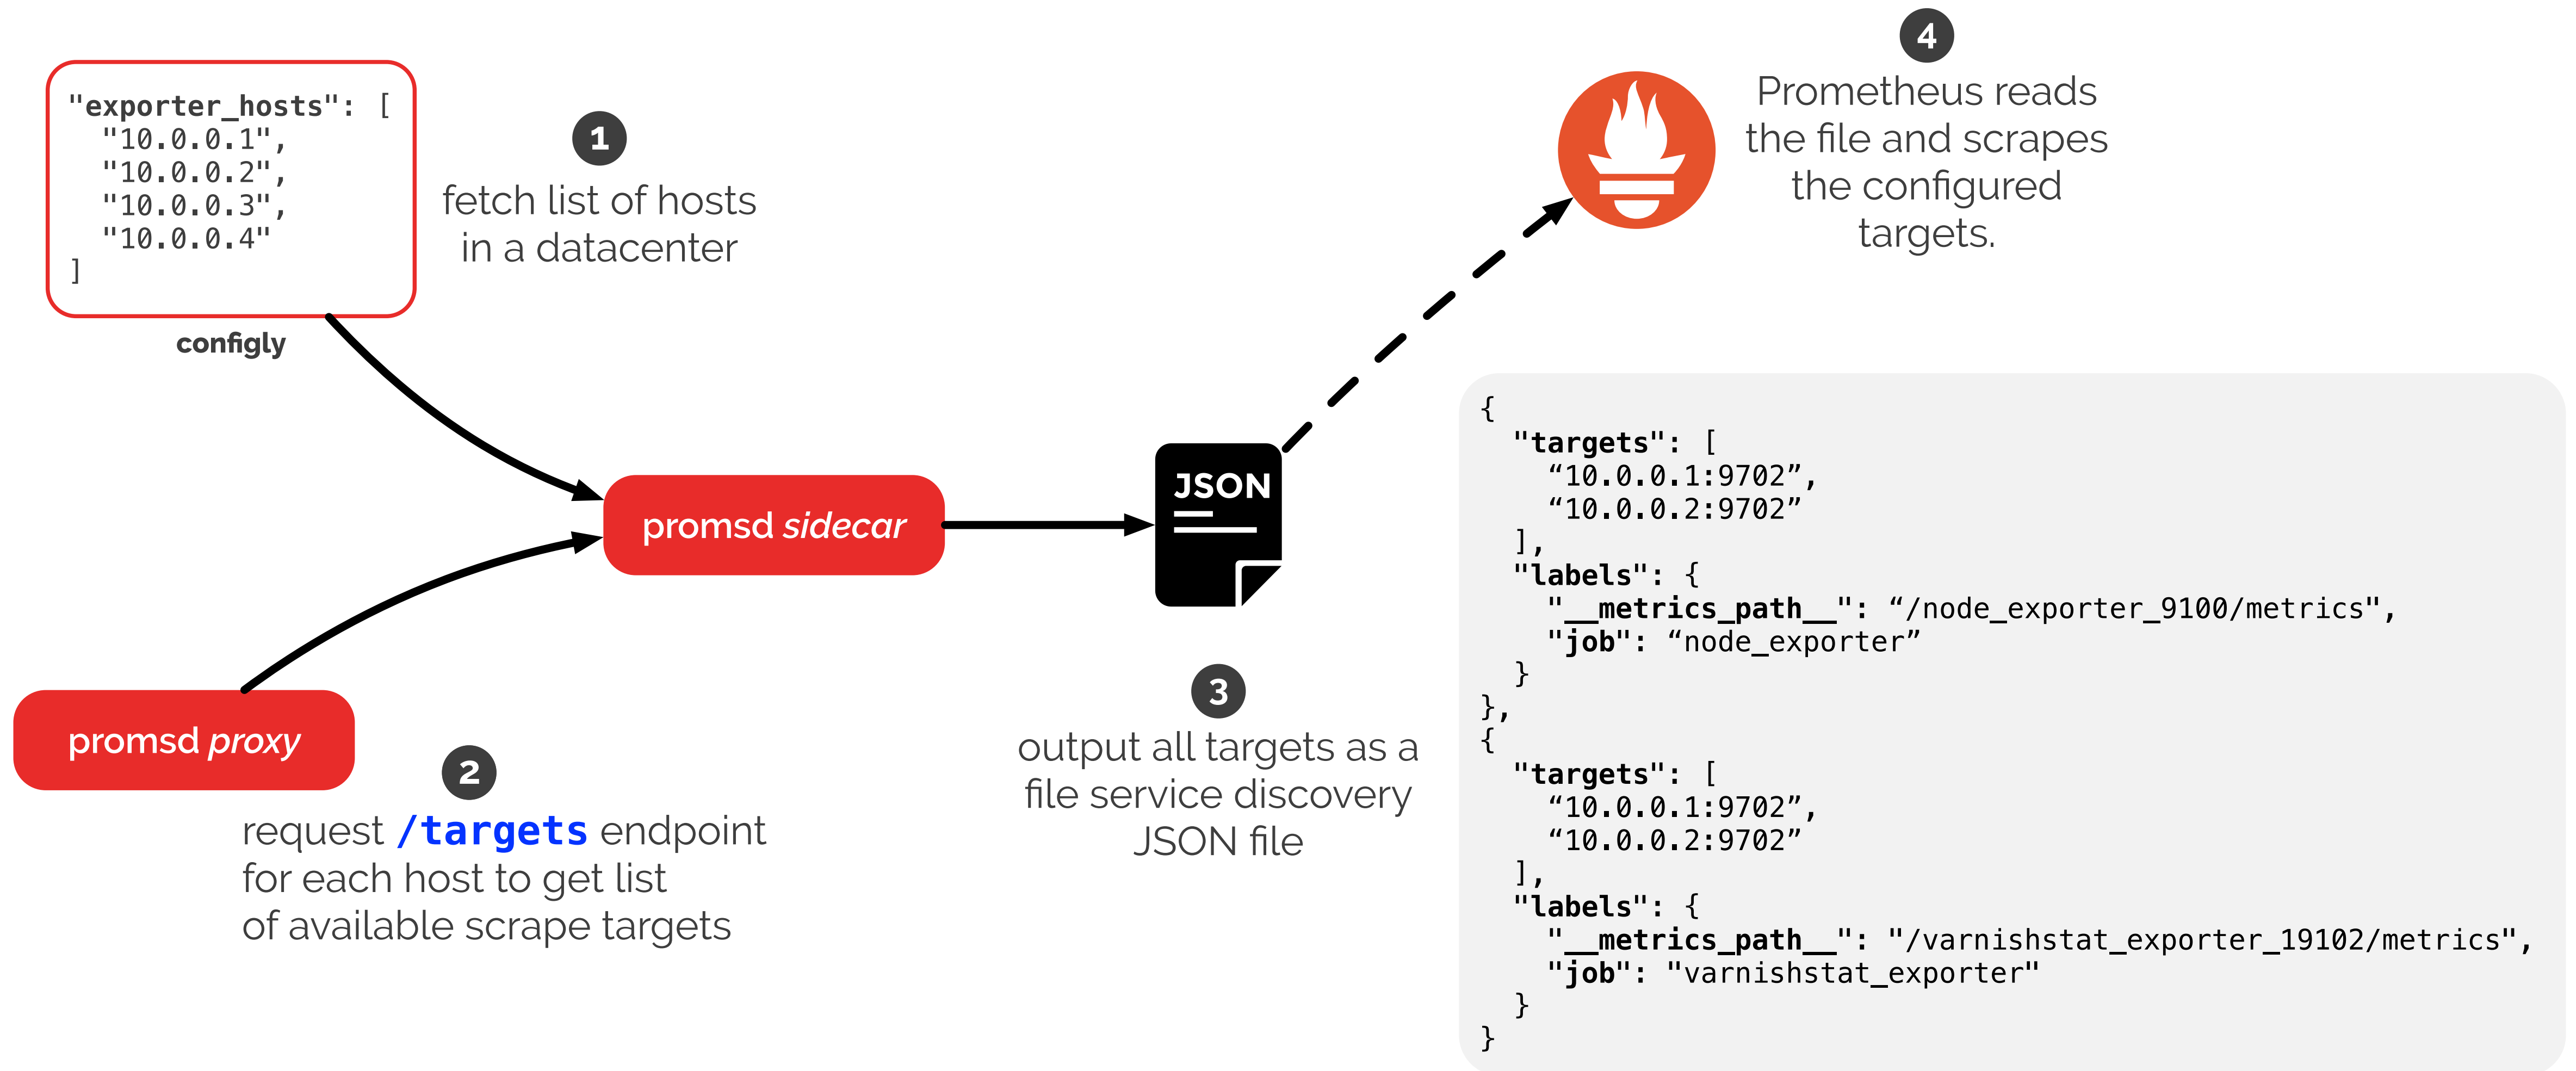

queries for
available targets

PromSD Proxy
Service discovery and
TLS exporter proxy

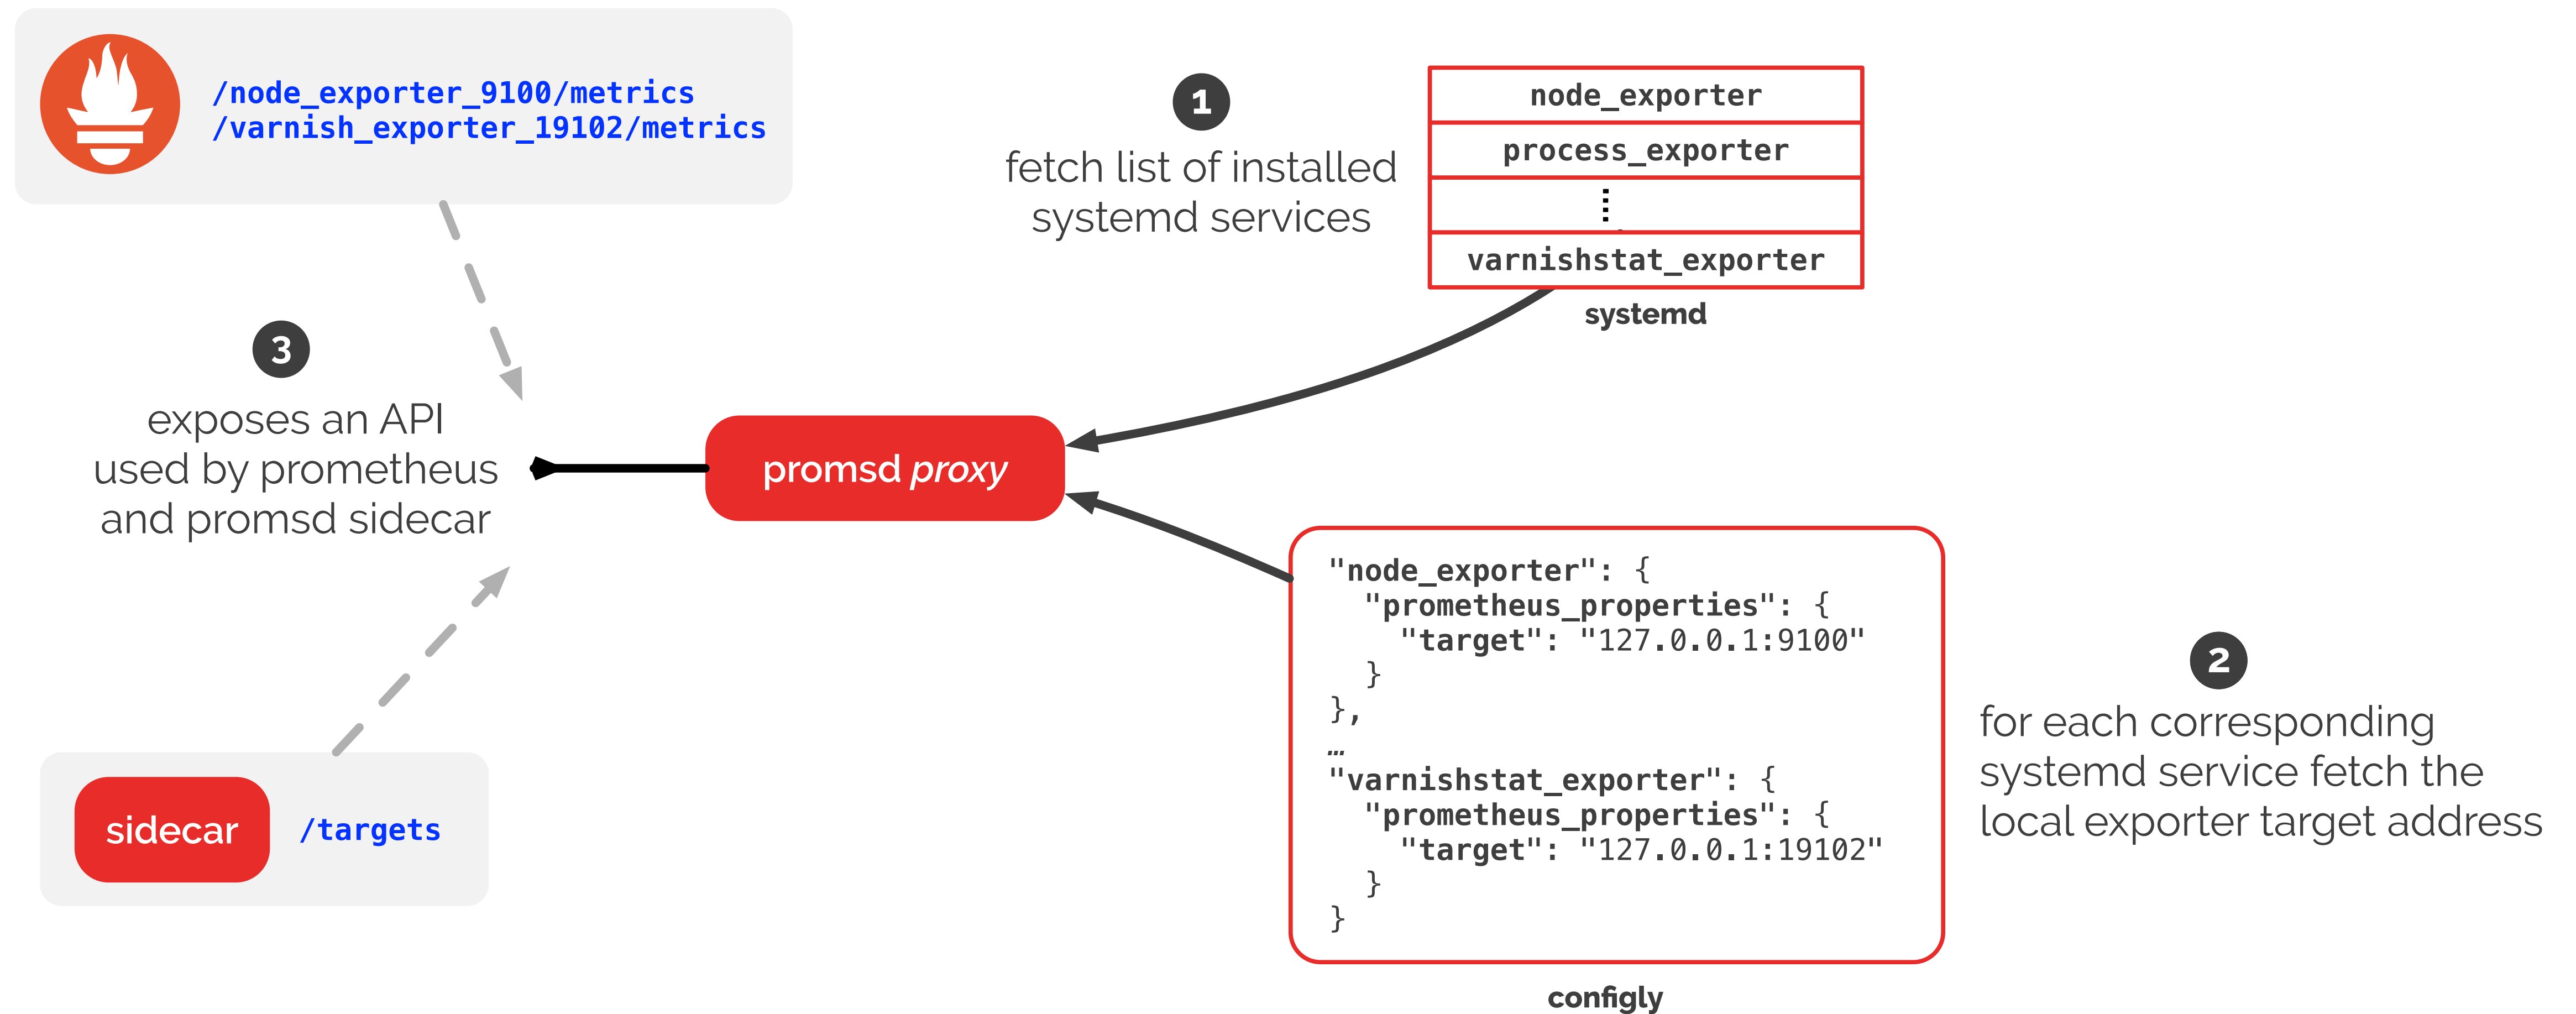

scrapes proxied targets over TLS

PromSD sidecar

PromSD proxy

It worked!

- ⦿ Really easy to leverage the file SD mechanism.
- ⦿ New targets can be added with one line of config.
- ⦿ TLS and authentication everywhere.
- ⦿ Single exporter port open per host.

Prometheus Adoption

Prometheus at Scale at Fastly

114 Prometheus servers globally
28.4M time series
2.2M million samples/second
... and growing!

Prometheus wins

- ⦿ Engineers love it.
- ⦿ Dashboard and alert quality have increased.
- ⦿ PromQL enables some deep insights.
- ⦿ Scaling linearly with our infrastructure growth.

Still some rough edges.

- ⦿ Metrics exploration without prior knowledge.
- ⦿ Alertmanager's flexibility.
- ⦿ Federation and global views.
- ⦿ Long term storage still an open question.

Thanks!
